1 BYKO = 1 BYKO

This document describes the BYKO token and the systems around it. Where this document and the deployed contract disagree, the contract prevails — the contract is the specification; this is its description. The document is versioned in the repository; every change is a commit and therefore traceable.

— 01 / TOKEN

The token

NAME	BYKO
SYMBOL	BYKO
STANDARD	ERC-20 — OpenZeppelin Contracts 5.4.0, unmodified
DECIMALS	18
TOTAL SUPPLY	790,227 BYKO = $790_227 \times 10^{18}$ base units, fixed
NETWORK	Base (OP-stack L2 on Ethereum)
CHAIN ID	8453
CONTRACT	0x078bB16e24c8931fc007928c370422e5e38F4372

The entire supply is minted once, in the constructor, to the deployer. The contract adds a single public constant (`MAX_SUPPLY`) on top of the inherited ERC-20 and nothing else. The source is 21 lines.

— 02 / INVARIANTS

What cannot change

- **Supply is fixed.** No mint function exists after the constructor. No burn function is provided; transfers to the zero address are rejected by OpenZeppelin's checks.
- **Nobody is in charge.** No owner, no admin role, no pause switch, no allowlist or blocklist, no transfer tax, no fees.
- **The code is final.** No proxy, no upgrade path. What was deployed is what runs, forever.
- **The source is public.** Verified on BaseScan with an exact match against the deployed bytecode.

— 03 / DEPLOYMENT RECORD

Deployed and done

CREATION TX	0xeac11a3210328c21d1c96bb1c7dafbfdbc2f4a51b510049fa3cdf232b64b9378
BLOCK	49,430,937

DATE	2 Aug 2026
DEPLOYER	omenas.base.eth
COMPILER	solc v0.8.34, optimizer default
VERIFICATION	BaseScan — Source Code Verified, exact match

— 04 / GENESIS DISTRIBUTION

One mint, split once

LIQUIDITY POOL	740,227 BYKO 93.7%
FOUNDER	50,000 BYKO 6.3%
TOTAL	790,227 BYKO 100%

Pool funding tx: 0xc1ea5195a255df6ad0439b106fcd575a3e98fc2d43b3a94adb7935f45b3337f2

The pool, on the chain

POOL	BYKO/USDC on Aerodrome (Base)
POOL ADDRESS	0x02dd4285ad38ea93d021ca854016a839b0b2a6ca
GENESIS RATIO	740,227 BYKO : 74.0227 USDC
USDC CONTRACT	0x833589fCD6eDb6E08f4c7C32D4f71b54bdA02913 6 decimals

The website reads price and reserves directly from the chain (`balanceOf(pool)` on both tokens); no third-party price APIs are involved.

The liquidity position is permanently burned. LP tokens were sent to `0x...dEaD` on 7 Aug 2026 — burned, not locked: nothing is recoverable by anyone, including the founder, ever. The two transactions:

BURN 1 · 3.07%	0x176dbc759894fa605c78e95bc7b61f0254005358fed20ee70ef85b0c657d5476
BURN 2 · 96.93%	0xe47921b2208c15c8b2f95f07be37aa70269b46c7a38f7363817af8258da584c6

Live proof: the pool token's holder list on BaseScan shows the burn address at 100%. Nothing else in this section is a promise of liquidity or price.

A card, on the record

A voluntary donation of BYKO can be recorded as a numbered certificate — a donation card.

- **Donation address.** `0x42873C60bC22424dBB4518DF7bE8b7F9eF4ac1D6` — any BYKO Transfer to this address in a successful transaction at or after block 49,614,625 is eligible; earlier transfers are not.
- **Issuance.** The card service verifies the transaction receipt on Base, reads the transferred amount (the nominal) and the block timestamp (the date), and issues a serial in the form BK 0000001. Issuance is idempotent per transaction hash: one tx, one card, forever.
- **Contents.** Serial, nominal, date, transaction hash, an optional inscription supplied by the donor (at most 300 characters), and a bearer contact. On the public page the bearer contact is masked.
- **Permanence.** Each card is permanently available at `/card/{serial}` on the project site. One notification letter is sent to the bearer per card.

A card confers no rights, no yield and no claim on anything. It records that a donation happened. That is all it does.

Priced in euro, payable in tokens

The author accepts BYKO in payment for his own professional work. This section describes that arrangement precisely, because it is the one place where the token meets something outside the chain. Two levels are deliberately kept apart.

- **The token.** Unchanged by this section. The contract has no built-in functionality, holders acquire no rights, and the issuer owes nobody anything. Nothing here is enforced by, or recorded in, the contract.
- **One person's decision.** The author, and only the author, has chosen to accept the token in settlement of his own invoices. It binds no other party, present or future.
- **Base currency is the euro.** Work is priced in EUR. No price list is ever denominated in BYKO.
- **Rate at the invoice date.** The amount of BYKO is derived from the market rate on the date of the invoice: the reserve ratio of the BYKO/USDC pool on Base at one specific block, read from the chain the same way the project site reads the price. The block number is stated on the invoice, so the conversion is reproducible by anyone afterwards.
- **No fixed rate.** No rate is ever announced, guaranteed or held. There is no aggregator and no third-party quote in the path.
- **Tokens received are kept.** Accepting them creates no commitment to convert, sell or support the price.
- **Receiving address.** `0xe8fC8769934f9461F7adF6F440ff3883E28021Eb` — already one of the founder wallets disclosed on the project site, so anything paid in is visible inside the disclosed holdings rather than arriving somewhere unlisted.
- **Scope.** Consulting, tender and bid preparation, architecture and system audits, and hands-on engineering, in the fields behind the author's 25 years of enterprise work: national tax platforms, SEPA and SWIFT payments, regulated manufacturing, energy, government projects.
- **Scope and refusal.** Which engagements are accepted, and whether a given invoice is settled in BYKO at all, remains the author's decision. No obligation to accept any particular volume arises.
- **No floor.** Because the price is denominated in euro, a lower token price means only that an invoice takes more tokens. This arrangement puts no floor under the price of BYKO and is not intended to.

Best effort, no SLA

GET /API/HOLDERS

Holder count and supply distribution across BaseScan-style tiers (whale $\geq$ 10% of supply, then decades down: shark 1–10%, dolphin 0.1–1%, fish 0.01–0.1%, crab 0.001–0.01%, shrimp $<$ 0.001%), computed from on-chain Transfer logs.

GET /CARD/{SERIAL}

The donation card, as SVG.

These endpoints read chain state and never write to it.

Every change is a commit

This specification lives at `docs/specification.md` in the `github.com/bykovas/byko` repository, and this PDF is generated from it by a script versioned alongside. Changes are made by commit only, so the full history of every revision is public.

1.3 · 2026-08-17

Settlement in BYKO added (§7); disclaimer separates the token from one person's decision to accept it

1.2 · 2026-08-12

Wording: liquidity is burned, not locked

1.1 · 2026-08-07

LP burn recorded: pool liquidity permanently locked

Initial specification

BYKO IS A TOKEN WITH NO BUILT-IN FUNCTIONALITY, NO YIELD AND NO PROMISES, AND IT GIVES ITS HOLDER NO RIGHTS. THAT ONE PERSON ACCEPTS IT IN PAYMENT FOR HIS OWN WORK IS HIS DECISION ALONE. IT DOES NOT REPRESENT EQUITY, DEBT OR ANY CLAIM ON ANYTHING. NOTHING IN THIS DOCUMENT IS FINANCIAL ADVICE. VERIFY THE CONTRACT ON BASESCAN BEFORE INTERACTING. 1 BYKO = 1 BYKO.
